HOW BRAIN RECOGNISES?

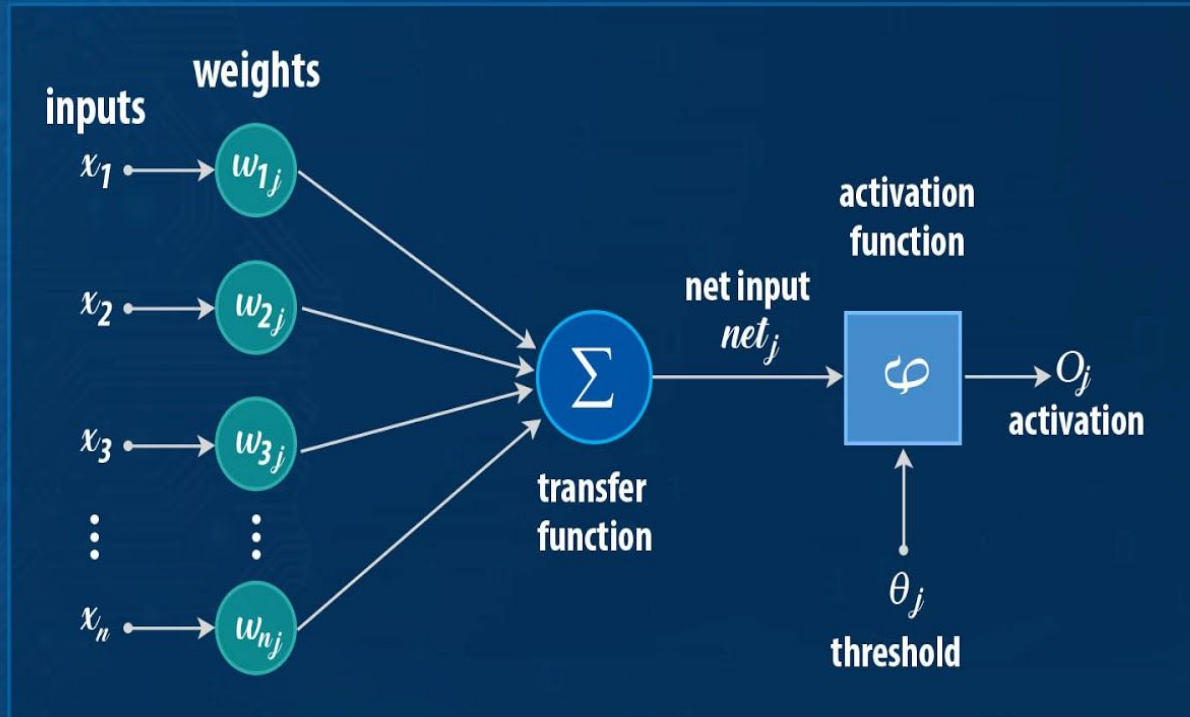

SINGLE PERCEPTRON

MULTI LAYER PERCEPTRONS

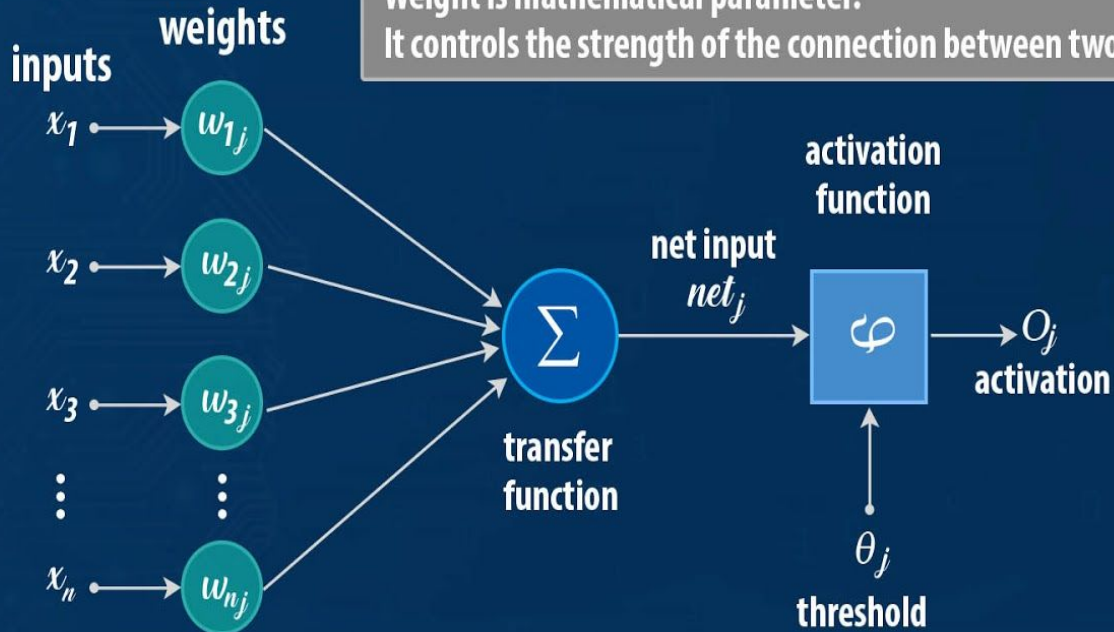

WORKING OF A NEURON

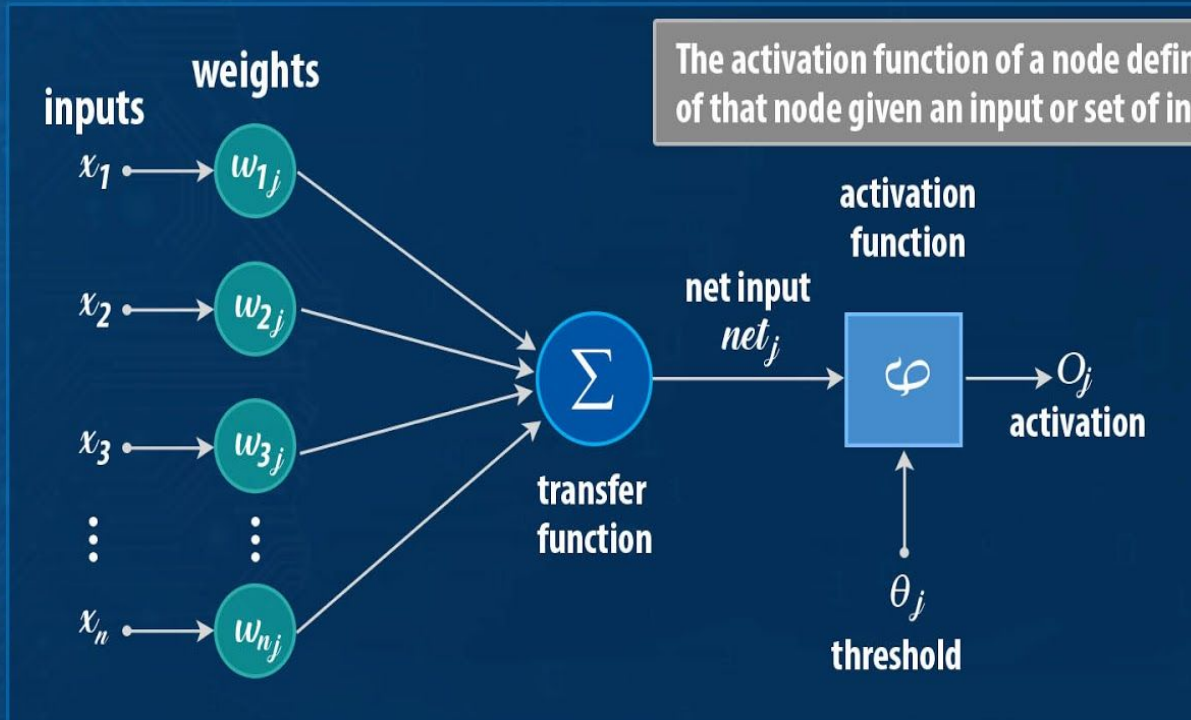

WORKING OF A NEURON

Weight is mathematical parameter.
It controls the strength of the connection between two neurons.

WORKING OF A NEURON

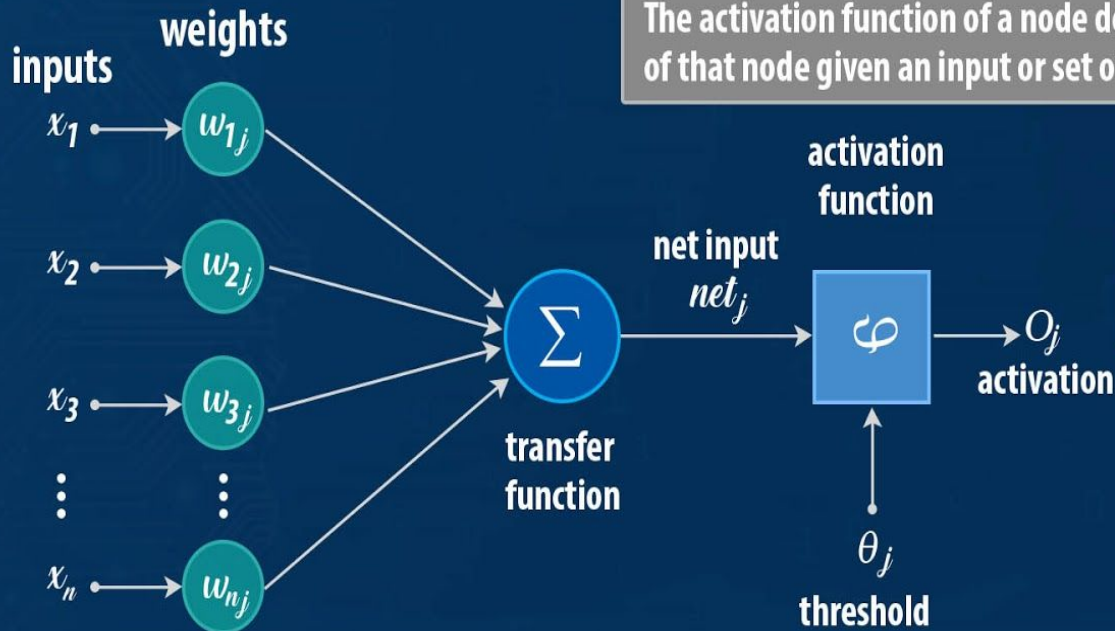

WORKING OF A NEURON

Case 1: Threshold of signal
is higher neuron is activated

WORKING OF A NEURON

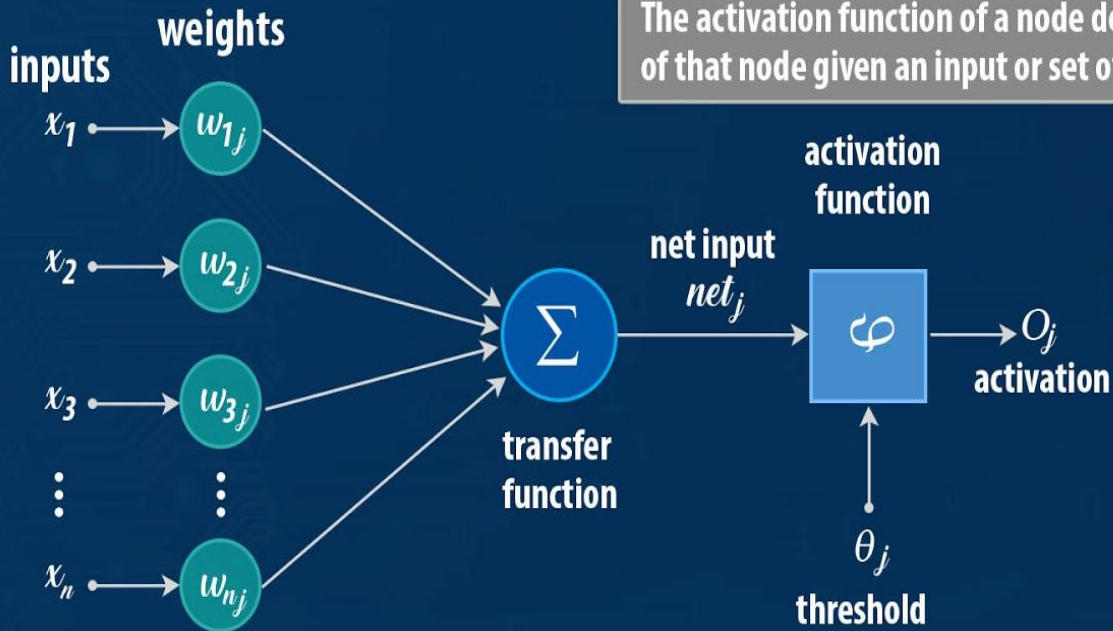

The activation function of a node defines the output of that node given an input or set of inputs.

Signal
gets fired

Case 2: Threshold of signal
is lower neuron is not activated

WORKING OF A NEURON

HUMAN BRAIN

Neurons enable brain to:

- Interpret
- Understand
- Comprehend

MULTILAYER NEURONS

Working of Multi layer Neurons

$$y_i = f \left(\sum x_i w_i \right)$$

$$y_k = f \left(\sum x_j w_j \right)$$

$$y_l = f \left(\sum x_k w_k \right)$$

MULTILAYER NEURONS

Working of Multi layer Neurons

Application:

- Classification
- Predication
- Identify number
- Identify category

$$y_i = f \left(\sum x_i w_i \right)$$

$$y_k = f \left(\sum x_j w_j \right)$$

$$y_l = f \left(\sum x_k w_k \right)$$

SUMMARY

Understanding Neuron

Working of neural network

Understanding Weights,
Activation Function

Role of Multilayer Neurons in
deep Learning
